Part I - Ford GoBike Dataset Exploration

by Darragh Merrick

Introduction

Dataset Overview and Notes

This data set includes information about individual rides made in a bike-sharing system covering the greater San Francisco Bay area.

Note that this dataset will require some data wrangling in order to make it tidy for analysis. There are multiple cities covered by the linked system, and multiple data files will need to be joined together if a full year's coverage is desired. If you're feeling adventurous, try adding in analysis from other cities, following links from this page.

Example Topics/Questions

When are most trips taken in terms of time of day, day of the week, or month of the year?

How long does the average trip take?

Does the above depend on if a user is a subscriber or customer?

> **Rubric Tip**: Your code should not generate any errors, and should use functions, loops where possible to reduce repetitive code. Prefer to use functions to reuse code statements.

> **Rubric Tip**: Document your approach and findings in markdown cells. Use comments and docstrings in code cells to document the code functionality.
>
> **Rubric Tip**: Markup cells should have headers and text that organize your thoughts, findings, and what you plan on investigating next.

Preliminary Wrangling

In [801…

```
# import all packages and set plots to be embedded inline
from requests import get
from zipfile import ZipFile
from io import StringIO, BytesIO
import numpy as np
import pandas as pd
import seaborn as sns
import missingno as ms
import matplotlib.pyplot as plt
import seaborn as sb
import geopandas as gpd
import folium
from shapely.geometry import Point, Polygon
import haversine as hs

%matplotlib inline
```

> Load in your dataset and describe its properties through the questions below. Try and motivate your exploration goals through this section.

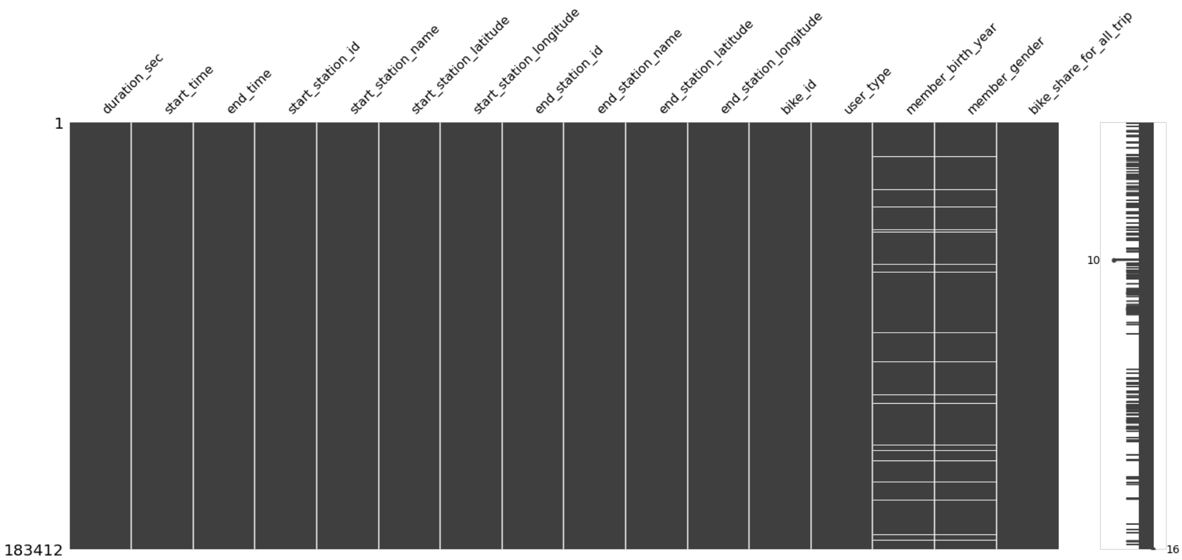
Data Cleaning

Missing data

Visualise missing data in the dataset

In [809…

```
ms.matrix(df);
```



There are quality and tidiness issues in the data, that will need to be addressed. The datatypes of multiple columns will need to be changed to gain insights such as:

- start_time object to datetime64
- end_time object to datetime64
- start_station_id float64 to object
- end_station_id float64 to object
- start_station_latitude float64
- start_station_longitude float64
- end_station_latitude float64
- end_station_longitude float64
- bike_id int64 to object
- member_birth_year float64 to int64

There are missing values in:

- start_station_id 197
- start_station_name 197
- end_station_id 197
- end_station_name 197
- member_birth_year 8265
- member_gender 8265

There are also invalid birth year values

There are other elements I could add like distance between start and stop, which would add useful information.

I would like to visualize the start and end locations on a map, which could also add useful information to this data study, even though it's not covered on this course.

In [810…

```
df.dropna(subset = ["start_station_id"], inplace = True)
df.member_birth_year.fillna(0, inplace = True)
df.member_gender.fillna("not defined", inplace = True)
```

In [811…

```
df['start_time'] = pd.to_datetime(df['start_time'], format = "%Y-%m-%d ")
df['end_time'] = pd.to_datetime(df['end_time'], format = "%Y-%m-%d ")
df['duration_sec'] = df['duration_sec'].astype(int)
df['start_station_id'] = df['start_station_id'].astype(str)
df['end_station_id'] = df['end_station_id'].astype(str)
df['start_station_latitude'] = df['start_station_latitude'].astype(float)
df['start_station_longitude'] = df['start_station_longitude'].astype(float
df['end_station_latitude'] = df['end_station_latitude'].astype(float)
df['end_station_longitude'] = df['end_station_longitude'].astype(float)
df['start_time'] = pd.to_datetime(df['start_time'], format = "%Y-%m-%d ")
df['bike_id'] = df['bike_id'].astype(str)
df['member_birth_year'] = df['member_birth_year'].astype(int)
#df['member_birth_year'] = df[df['member_birth_year'] < 2015]
```

In [812…

```

L-*0ooking at the 1 duration of 69.47:

start_lat, long	end lat, long	duration	Distance
37.7896254,-122.400811	37.3172979,-121.884995	6945 seconds (1.93 hours)	69.47km

5km every 10 minutes is an estimated average, which would give me 30km over the hour, so this would not be impossible.

From the map below, it looks like someone cycled from San Francisco to San Jose. This would not be impossible, so not going to filter it out as an outlier.

Univariate Exploration

> In this section, investigate distributions of individual variables. If you see unusual points or outliers, take a deeper look to clean things up and prepare yourself to look at relationships between variables.
>
> **Rubric Tip**: The project (Parts I alone) should have at least 15 visualizations distributed over univariate, bivariate, and multivariate plots to explore many relationships in the data set. Use reasoning to justify the flow of the exploration.
>
> **Rubric Tip**: Use the "Question-Visualization-Observations" framework throughout the exploration. This framework involves **asking a question from the data, creating a visualization to find answers, and then recording observations after each visualisation.**

What is/are the main feature(s) of interest in your dataset?

> The trip duration and start and end station Lat Longs could generate interesting results. Most popular start stations and end Stations could show interesting trends. Start and end times show year-month-day, so we can find trends of popular times, days, months and seasons. Statistics about gender and age may also show the most popular groups that tend to cycle.

What features in the dataset do you think will help support your investigation into your feature(s) of interest?

> Gender, Age and user type will help profile the customers Start_station_ID and End_Station_id will help find the most popular routes, to assist bike redistribution. Bikes will need to be moved from the most popular destinations to the most popular starting points to keep bikes available at popular starting points. start_time and end_time will help investigate cycle durations and peak

> times.

> **Rubric Tip**: Visualizations should depict the data appropriately so that the plots are easily interpretable. You should choose an appropriate plot type, data encodings, and formatting as needed. The formatting may include setting/adding the title, labels, legend, and comments. Also, do not overplot or incorrectly plot ordinal data.

Discuss the distribution(s) of your variable(s) of interest. Were there any unusual points? Did you need to perform any transformations?

> In the duration_sec graph, I used a log scale to get an uniform distribution. The count of Age and Distances are positively skewed distributions

A distribution is said to be skewed to the right if it has a long tail that trails toward the right side. The skewness value of a positively skewed distribution is greater than zero.

> The count of birth years is a negatively skewed ditribution.

Of the features you investigated, were there any unusual distributions? Did you perform any operations on the data to tidy, adjust, or change the form of the data? If so, why did you do this?

> I didn't find any of the results to be unusual. The most common age groupos were 25 -40 The most common trips were between 0.5 to 2.5 km, although there was one trip from San francisco to San Jose which was 69.47km. I did find it surprising that over 70% of users were male, I would have expected a more even gender usage.

```

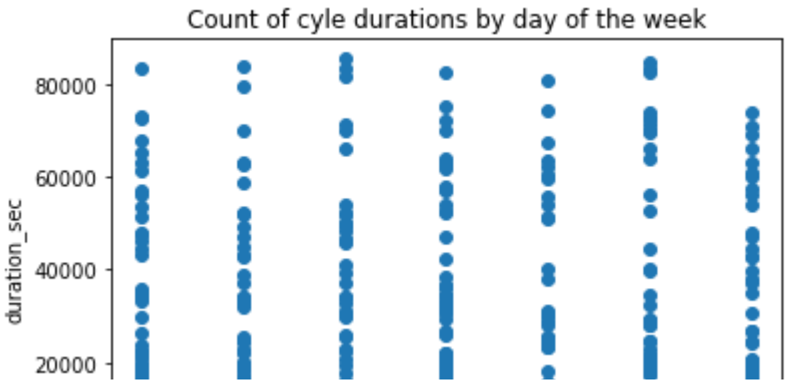
Out[134… Text(0, 0.5, 'duration_sec')



Talk about some of the relationships you observed in this part of the investigation. How did the feature(s) of interest vary with other features in the dataset?

- The durations cycled each day do not vary greatly
- The group born between 1985 and 1995 are the most common and cycel for the longest durations.
- Customers tend to cycle longer distances and subscribers tend to cycle shorter distances more often.
- Younger users tend to be subscribers more than customers.
- Durations cycled does not vary greatly between genders.
- Males marginally cycle greater distances

Did you observe any interesting relationships between the other features (not the main feature(s) of interest)?

- I found the data to be balanced. The most common users were born around 1985 and 1995 and cycled the farthest. Usage

Multivariate Exploration

> Create plots of three or more variables to investigate your data even further. Make sure that your investigations are justified, and follow from your work in the previous sections.

Talk about some of the relationships you observed in this part of the investigation. Were there features that strengthened each other in terms of looking at your feature(s) of interest?

- Customers cycled over double the average duration than subscribers. The not defined gender cycled for the longest durations, which means either, male or female didn't specify their gender or there were outliers in the data.
- The average distances didn't vary greatly between customers and subscribers, which means there could have been long periods of time where people weren't cycling, because greater cycling durations should equal greater distances cycled.

- distances greater than 12km cycled were only by users born between 1990 and 2000, but these could be outliers.

- Any distance recorded over 10km was by a male user.
- it can be seen that users males cycled the farthest distances, followed by females, then other.

Were there any interesting or surprising interactions between features?

```
df.to_csv("master_data_frame.csv", sep=',', encoding='utf-8')
```

Conclusions

- This data covers three areas: San Francisco, East Bay and San José
- There are alot more male users than other users, for all areas there are always over 64% male
- There are a lot more subscribers than customer using this service
- The average user over all data is most likely between 24 and 35 years old
- People use the bikes more/in higher counts during the week than during the weekend
- The majority of trips are less than 2km long.
- There is an increasing trend of usage
- People start their trips most frequently at 8 and 17 'o clock

During this project I had to clean the data and used folium to plot the Lat Long start and finish locations to visualise the journeys. I analysed the data by plotting exploratory graphs, then used Univariate, Bivariate and Multivariate graphs to further explore the relationships and trends od duration and distances cycled by age, gender and user type. I felt ther was no major surprises from the findings, other than males were the majority of users.
